10 MOTION GRAPHICS EFFECTS

made with only Claude Code

Every prompt behind the effects in my video: newspaper highlights, a 3D globe and map zoom, text behind you, title cards, callouts, chapters, data graphics, a logo reveal, chat conversations and a 3D phone mockup. Copy, paste and swap in your own details (anything highlighted like this).

BEFORE YOU START

What you need

- **Claude Code**, in your terminal or the Claude desktop app.
- **DaVinci Resolve Studio** for long videos, so you can see every effect on a timeline. For a one or two minute video you can skip it and let Claude Code render the whole thing.
- Your talking head recording, filmed normally. Every effect is added on top afterwards.

The setup prompt (use this first)

> I'm editing a talking head video: path to your video.
> Transcribe it with Whisper with word level timestamps. Cut the long pauses and any line I restart, and always keep my last take. Check that no word ending gets clipped.
> Every effect I ask for should be a transparent overlay (ProRes 4444) timed to the exact words I say, placed in the free side of the frame so it never covers my face. Use my brand colours your hex codes and fonts your fonts.
> Then build the timeline in DaVinci Resolve through its scripting API: my video on track 1, each effect on the tracks above.

Why it works: once Claude has the transcript, it knows the exact frame you say every word, so every effect lands on time without you marking anything.

Three habits that save the most time

- **Give timestamps.** "At 6:30 do this" is faster and more accurate than asking Claude to find the moment itself.
- **Give links, not screenshots.** Claude can open the page, close the pop-ups and capture it cleanly.
- **Ask for two or three variations.** Renders are fast, and picking one is easier than describing exactly what you want up front.

01 NEWSPAPER HIGHLIGHT

The documentary effect: an article appears and the line lights up as you read it

> When I say " your trigger words ", show a newspaper clipping of this article: article link .
> Open the page yourself in a headless browser, close any sign-in or cookie pop-ups, and capture the article at 2x. Turn the headline, photo and first paragraph into a clean card with rounded corners on the right of the frame.
> When I read the lead sentence, sweep a yellow highlighter across each word exactly as I say it, using the Whisper word times. Push in on the sentence while it's highlighted, then pull back out.

Tip: show Claude opening the page on screen for a second. Viewers love seeing that it found the article itself.

02 GLOBE AND MAP ZOOM

For anyone who tells stories about places

> When I say "globe", spin in a 3D dotted globe in your colour on the right of the frame.
> When I mention your places , draw glowing arcs between them and drop a pin on each.
> Then zoom all the way into your city as a full screen map with clean country borders, a pin and a label. Cut me out of every frame of that part and keep me in front of the map, so I stay on screen.

Tip: ask for real map data (Natural Earth is free) so the coastlines look right.

03 TEXT BEHIND SUBJECT

Looks like hours of editing, takes one prompt

> When I say " your words ", put each word in huge yellow bold letters behind me, one word at a time, each one filling the background, then stack all of them.
> Run a person segmentation model on every frame (rembg u2net_human_seg works well), smooth the matte across neighbouring frames so the edges don't flicker, and stack the layers: background first, then the text, then me on top.

04 TITLE CARD

For introducing yourself or a guest

> When I introduce myself, add a title card in the free side of the frame: " your name " in a white pill with a colour accent bar, and " your title " in a smaller pill underneath. Slide it in and out in under half a second and keep it on screen for about eight seconds.

Tip: save this as a template. Next time just say "add my title card when I say my name".

05 CALLOUTS AND ZOOM

Essential for any tutorial with a screen recording

> At 6:30 , draw a hand drawn yellow circle around the New session button .
> At 6:33 , add an arrow pointing at it, then zoom into it for two seconds so it's readable on a phone.

Tip: Claude can look at the frames and find the button itself, but giving the exact timestamp is faster and more accurate.

06 CHAPTERS AND PROGRESS BAR

Good for retention: people see how far along they are and what's next

> From my transcript, find where I start each new section and add a thin progress bar along the bottom of the video, with one segment per chapter that fills as the video plays. Each time a new chapter starts, pop up a small chapter card with its number and name.
> Then write the chapter timestamps for my YouTube description , at 1.1x if I'm speeding the video up .

07 DATA GRAPHICS

For the moments where a number is the whole point

> When I say " your number ", show it counting up from start to end on rolling odometer digits, timed so it lands on the final number as I say it. Put it in a card next to a phone showing my real Instagram profile (capture instagram.com/yourhandle).

Tip: this works for any number: revenue, members, downloads, countries.

08 LOGO REVEAL

The thing people usually pay a motion designer for

> Take my logo file path to your logo , sample a few thousand points from its shape and animate each point flying in from a random position until they all land and form the logo, then fade in the wordmark underneath.
> Make two or three variations, for example triangles rising, squares morphing into circles then triangles, and a dot ripple, so I can pick my favourite.

09 CHAT CONVERSATION

Great for storytelling

> Show this conversation as an Instagram DM on the right of the frame:
> [their message] / [your reply] / [their message] / [your reply]
> Pop each bubble in one at a time as I say it, with typing dots before each one, timed to my voice, and add a little message sound for each.
> When I say "X post", "WhatsApp" and "DM", restyle the same chat in each app's real look.

10 3D PHONE MOCKUP

The way to show off your finished edits

> Put my finished reel [path to your reel] inside a 3D phone that flips in from the right, does a full turn when I say "turns in 3D", rotates gently while I talk, and gets a glass reflection sweep when I say "reflection".
> Use real phone proportions (19.5:9), fit the reel to the screen width so none of its text gets cropped, and add a soft floor shadow.

Tip: this one took me the most back and forth, around three renders, mostly to get the angle right and the phone to look natural. Ask for a few angles first.
