

FREE KIT

The Lead Magnet *Funnel* Kit

The system behind every free download on womenlead.ai: the page, the email form, the database, the tracking and the Instagram DMs. Built with Claude Code on free plans, step by step, with every prompt to copy.

BY WIKTORIA KORBECKA · WOMEN LEAD AI · WOMENLEAD.AI

THE FUNNEL ON ONE PAGE

What you're *building*

Someone watches your video, comments a keyword or clicks your link, lands on a page on your own website, gives you their email and gets the download straight away. Their email is saved together with the video that sent them. Then your site shows them your offer.

1	2	3	4	5	6
Your video	Comment keyword or link	Lead magnet page	Email form	Database and tracking	Your offer

WHY BUILD YOUR OWN

Most landing page tools charge more as you add pages and contacts, so the better it works, the more it costs. Built with Claude Code, every new lead magnet costs a few minutes and nothing else, and it lives on your own website next to everything you sell.

WHAT YOU NEED (ALL HAVE FREE PLANS TO START)

- [ ] **Claude** on a paid plan, so you can use Claude Code. It builds everything.
- [ ] **GitHub** stores your website's files.
- [ ] **Vercel** puts your site online. Sign up with your GitHub account so they're connected.
- [ ] **Supabase** is the database where the emails are saved.
- [ ] **ManyChat** sends the link when someone comments your keyword on Instagram.

> **You don't need to code.** You need to know what you want each step to do. Every prompt is below.

STEP 1

01

Your brand *folder*

Make a folder for the project. Inside it, make a folder called **brand** and drag in your logo, brand guidelines, fonts and two screenshots of posts that look the way you want everything to look. Open Claude Code on the project folder (in the desktop app it's the Code tab) and paste:

```
Read everything in the brand folder and write a BRAND.md file that sums up my colours (with hex codes), fonts, logo rules and the overall look. Add a list of things to never do, like gradients, stock photos or purple. Use this file for everything you make in this project.
```

Check it properly. If a colour is slightly wrong in BRAND.md, it will be slightly wrong on every page you ever make.

STEP 2

Make the *lead magnet*

Make every lead magnet from a video you've already made: the exact prompts, settings and tools from that video, turned into something people can keep. Drag in the transcript and a file of the prompts you actually used, then:

```
Make a lead magnet PDF from this transcript and these prompts. Use only the prompts I actually used, word for word, do not improve or rewrite them. Follow BRAND.md. Add a cover with the title, a short intro in my voice, one page per step, and a last page inviting them to my community. Save it as public/downloads/[name].pdf and also export the cover as an image.
```

The words that matter: "word for word, do not improve them". Otherwise AI tidies your prompts, they stop giving the result from your video, and that's the fastest way to lose someone's trust.

STEP 3

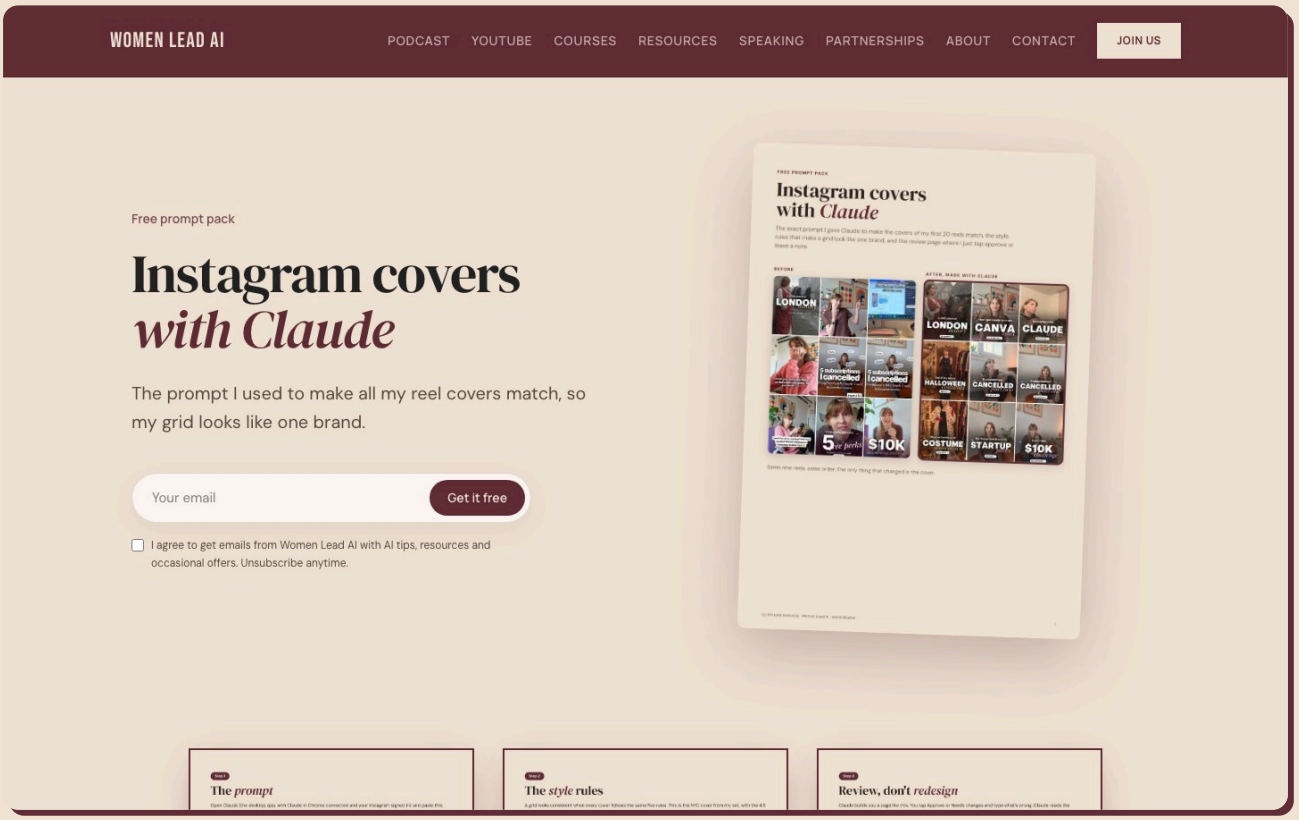

The website and *one template*

This is the biggest prompt in the kit, and the one worth spending time on: every future lead magnet reuses this template.

```
Build me a simple website in this folder with Next.js, following BRAND.md. I need a
/resources page that lists all my lead magnets as cards, and a reusable template for a
single lead magnet page at /resources/[slug]. The template has: the cover tilted on the
right, the title and one line intro on the left, an email form under it with a 'Get it free'
button and a consent checkbox, three preview images, a short 'What's inside' list, and a
small invitation to my community at the bottom. Make the first page for the PDF we just
made. Then run it so I can see it.
```

Claude opens the site on your computer, where nobody else can see it yet. Ask for changes in plain words ("make the button my burgundy", "one line intro only") until you love it. After that, a new lead magnet is just:

```
Add a new resource page for [NAME] using the same template. Here's the PDF, three preview
images and a one line intro. Use the slug [slug].
```

One of my pages made from the template: womenlead.ai/resources/ig-covers-prompt

STEP 4

Save the emails in *Supabase*

1. At supabase.com click **New project**, give it a name, set a database password (save it somewhere safe) and pick the region closest to your audience.
2. Back in Claude Code, paste the prompt below.
3. In Supabase open **SQL Editor**, New query, paste Claude's SQL and press **Run**.
4. In **Table Editor** check the leads table has every column, especially the utm ones.
5. In Project Settings, API Keys, copy the **project URL** and the **publishable key**.

```
Write me the SQL to run in Supabase that creates a leads table with: id, created_at, email,
resource (which lead magnet), and utm_source, utm_medium, utm_campaign, utm_content,
utm_term. Turn on row level security and only allow inserts from the website, never reads,
so nobody can download my list.
```

> **Never** paste the secret key into anything Claude builds for the public. The publishable key is the one made for websites.

STEP 5

Connect the *form*

```
Connect the email form to my Supabase leads table. Here's my project URL and publishable
key, keep them in .env.local. When someone submits, save their email and which lead magnet
it is, then start the download straight away. If saving fails, never block the download,
just log the error. The consent checkbox has to be ticked first.
```

Test it: sign up with a test email, refresh the Table Editor and check the row appears.

STEP 6

04

Know which video *worked*

UTM tags are labels on the end of a link that say where a visitor came from, for example **?utm_source=instagram&utm_campaign=my-kit**. Once you have a few videos pointing at your site, they tell you which one actually brings sign ups.

```
When someone lands on any page with utm tags in the link, remember them for the rest of
their visit, and save them with their email when they download.
```

Test with a real link and look at the database yourself. AI builds exactly what you ask for, but you still have to check the last step actually happened.

STEP 7

Put it online with *GitHub and Vercel*

```
Put this project on GitHub as a private repository called [name] and push everything. Don't
push .env.local.
```

1. At vercel.com click **Add New**, **Project** and import the repository.
2. Before you deploy, open **Environment Variables** and add the same Supabase URL and publishable key.
3. Press **Deploy**. A minute later you have a live link. Add your own domain in Settings, Domains.
4. Sign up once on the live page with a utm link, and check the row in Supabase.

One habit to copy: never let Claude push without you saying so. Every push goes live.

STEP 8

05

Send people there from *Instagram*

1. In ManyChat make a new automation with the trigger **user comments on your post or reel**.
2. Set your keyword (mine for this video is FUNNEL) and pick the reel.
3. Write the DM: one short line and a button with your page link, ending in **utm_source=instagram**.
4. Test it from your own phone: comment the keyword and wait for the DM.

Then say the keyword out loud at the end of your reel and put it on screen.

STEP 9

And from *YouTube*

Put the link in the description and in a pinned comment, with a different **utm_medium** on each (video_description, pinned_comment), so you can see which one people click. Ask Claude to write both links every time you upload.

STEP 10

Show them *what's next*

```
Add a small popup that appears after someone has been on a lead magnet page for 10 seconds,
inviting them to [your offer] with a button to [link]. Easy to close, and don't show it
again in the same visit.
```

Why wait ten seconds: a sales message before they've even got their free thing feels like a trick.

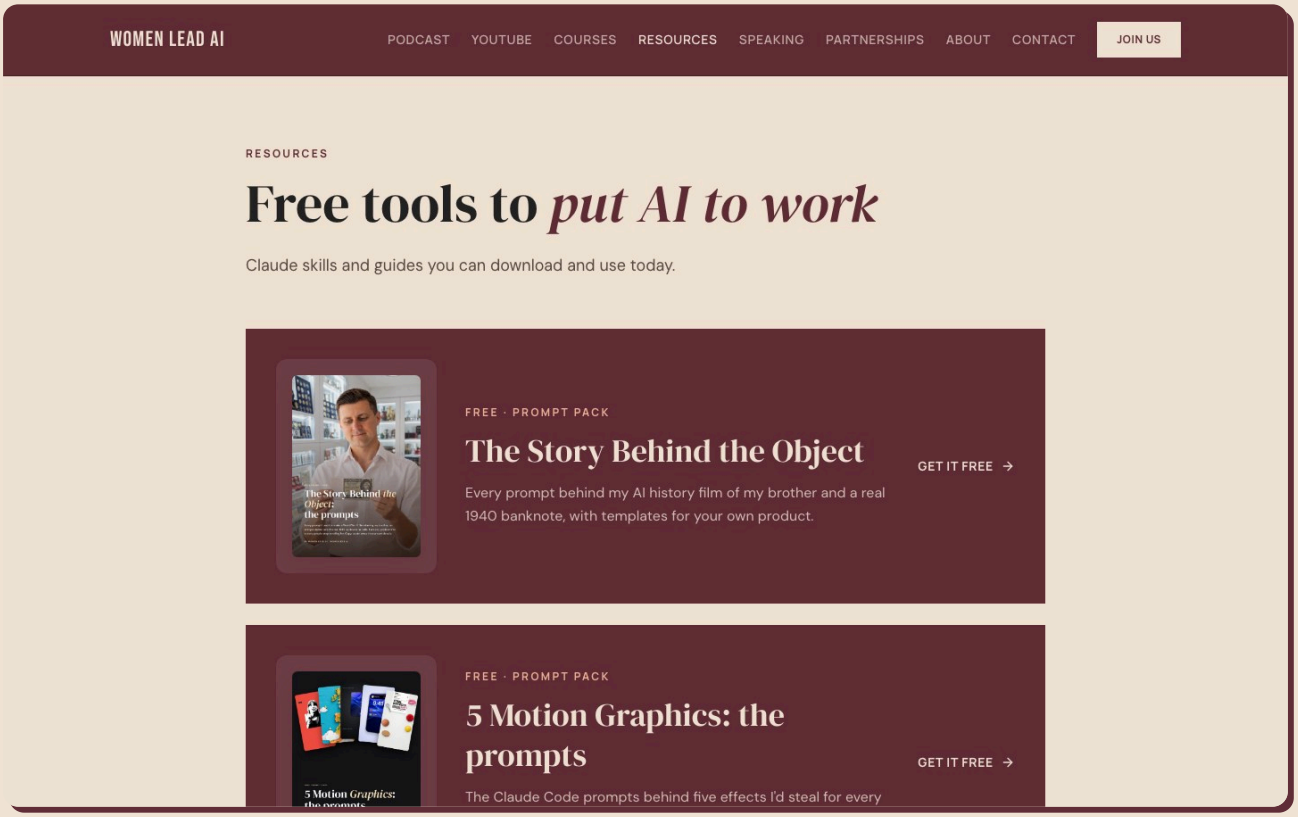

THE SHORTCUT

Turn it into *one command*

Once your template works, every new lead magnet is the same few steps: make the PDF from the video, export the cover and previews, add the page, and add it to the resources list. So I turned the whole process into one command, **/leadmagnet**. When I finish editing a video, I run it and Claude makes the lead magnet with the prompts I used, the commands I ran and anything that needs to be installed.

Ask Claude to make yours:

```
Make me a Claude Code slash command called /leadmagnet for this project. When I run it after finishing a video, it should: read the video's transcript and the prompts I used, make the lead magnet PDF following BRAND.md (prompts word for word), export the cover and three preview pages as images, add a new resource page from the template, add it to the /resources list and the sitemap, and run the site so I can check it. Never push to GitHub until I say so.
```

My resources page: every card on it came out of this process.

BEFORE YOU GO

Three things to *remember*

1. **Make lead magnets from content that already worked**, and tell the AI not to change your prompts, so the free thing gives people the result they just watched.
2. **Spend your time on the first page** and turn it into a template. Every lead magnet after that is a cover, a line of text and one prompt.
3. **Test the whole thing with a real link** and look at your database with your own eyes.

Build things like this *with us*

Women Lead AI is a free community for women learning to use AI in their careers and businesses: real workflows, weekly wins and people who get it.
