FREE GUIDE

10 free GitHub libraries for *animating* with Claude Code

The exact open source tools behind my "every frame drawn by Claude" reel.
No video model, no After Effects, just Claude Code and code.

BEFORE YOU START

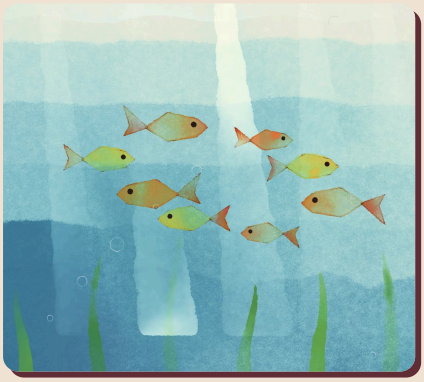

How to use *any* of these

You don't need to know how to code. Claude Code reads the library for you. For every tool in this guide the move is the same:

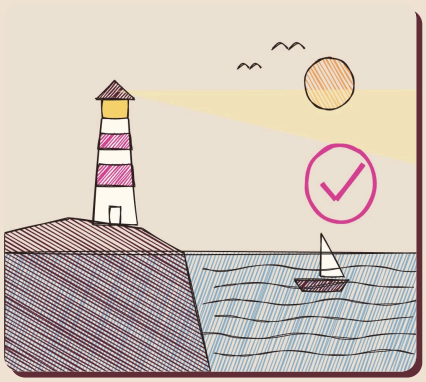

1. **Open Claude Code** in an empty folder (pick Opus, effort high).
2. **Paste the GitHub link** of the library and say what you want to make with it.
3. **Attach a reference**: a Pinterest pin, a film still, a page from a picture book. Say what you love about it.
4. **Give it a topic, a length and a format**, for example "15 seconds, 9:16, 30 fps".
5. **Ask it to render an MP4 and check its own frames** before it shows you anything.

A STARTER PROMPT

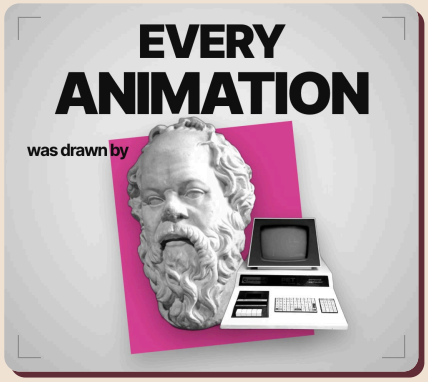

```
Use [library GitHub link] to make a [length] animation about [topic] in [format].
Match the style of the reference I attached: [what you love about it].
Every frame must be drawn in code, no video model.
Render it to MP4 with HyperFrames or ffmpeg, then take snapshots at 5 points,
look at them, fix anything that looks off, and only then show me the result.
```

Watercolour (p5.brush)

Hand drawn (Rough.js)

Editorial collage (GSAP + rembg)

One reference per scene. The clearer the reference, the closer Claude gets on the first try. "Like this, but in my pink" beats a long description.

Every scene in my reel rendered with it

01

HyperFrames

github.com/heygen-com/hyperframes

Turns an HTML page into a video, frame by frame, so every render comes out identical. It's the reason you can use any web animation library and still get a clean MP4.

```
Set up a HyperFrames project for a 9:16 video at
30 fps. Build each scene as its own composition,
render each one, then snapshot the frames and
check them before rendering the final.
```

Kinetic type timed to my words

02

GSAP

github.com/greensock/GSAP

The animation timeline behind most motion design on the web, and completely free. Perfect for kinetic typography, pops, slides and blur reveals that land exactly on a word.

```
Animate this script as kinetic typography with
GSAP. Big black words stacked with small ones,
each word enters with a blur and slide exactly on
the timestamp I give you.
```

PAINTED LOOKS

Generative macro shapes

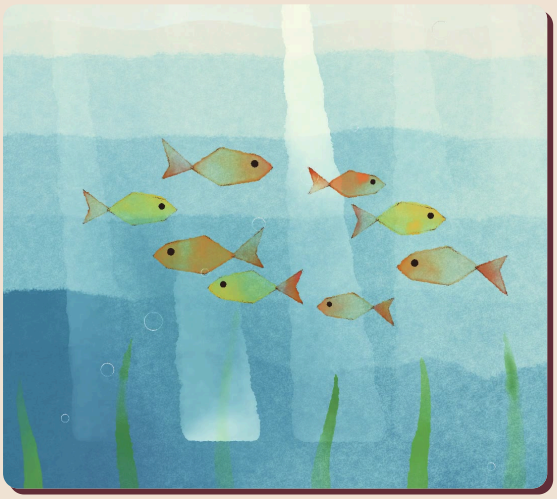

03

p5.js

github.com/processing/p5.js

A friendly creative coding library for drawing shapes, patterns and generative art. Great for kaleidoscopes, particles and anything organic.

```
With p5.js, draw a slow kaleidoscope of orange
petals on black that rotates and pushes in over 4
seconds. Seed the randomness so every render is
identical.
```

The watercolour sea in my reel

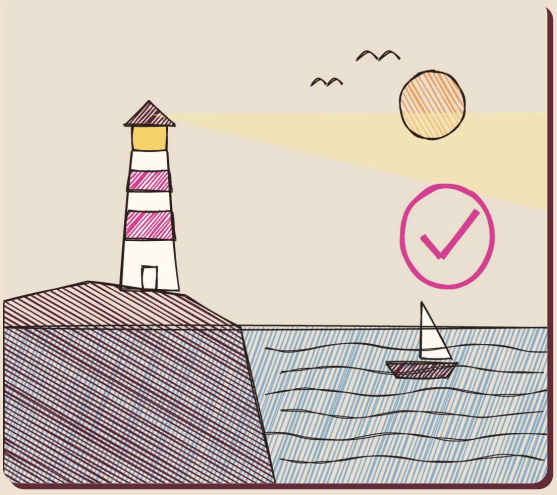

04

p5.brush

github.com/acamposuribe/p5.brush

Real looking watercolour, pencil and ink brushes on top of p5.js. Washes bleed, pigment pools at the edges, and it looks hand painted.

```
Use p5.brush to paint an underwater watercolour
scene: layered blue washes, light rays, swaying
seaweed and a school of fish with ink outlines.
Animate on twos (12 fps) like hand drawn
animation.
```

A sketch that draws itself

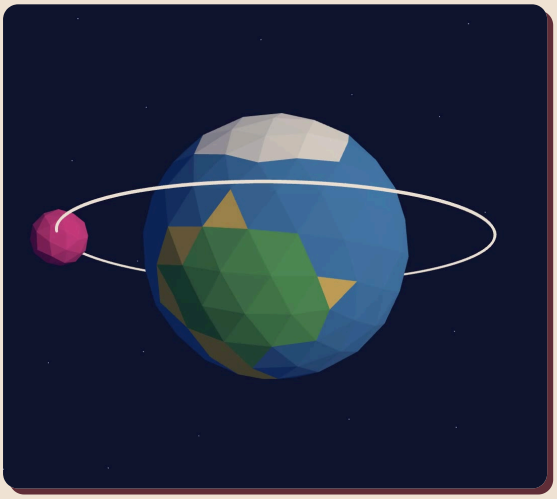

05

Rough.js

github.com/rough-stuff/rough

Makes everything look sketched by hand: wobbly lines, hatched fills. Combine it with a stroke draw on and the drawing builds itself line by line.

```
Draw a lighthouse on a cliff with Rough.js as
SVG. Animate each line drawing itself in, then
the hatched colours, then a pink tick stamp at
the end.
```

The low poly planet

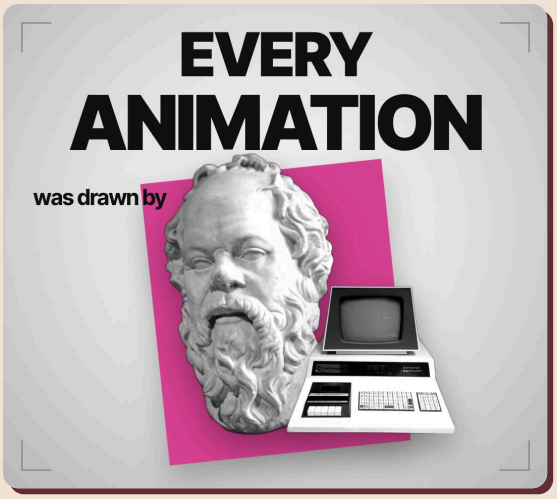

06

Three.js

github.com/mrdoob/three.js

The standard for 3D on the web. Low poly worlds, product spins, floating objects, camera moves, all in code.

```
Make a low poly planet in Three.js with flat
shading, a small pink moon orbiting it, a thin
ring and a starfield. Slow camera push in over 2
seconds.
```

Cut-outs for the editorial look

07

rembg

github.com/danielgatis/rembg

Removes the background from any photo in one line. It's how you get those black and white cut-outs (a statue, an old computer, a teddy) for the collage style.

```
Find public domain photos of [objects] on
Wikimedia Commons, cut each one out with rembg,
make them high contrast black and white and save
them as transparent PNGs.
```

Drawn frame by frame in Node

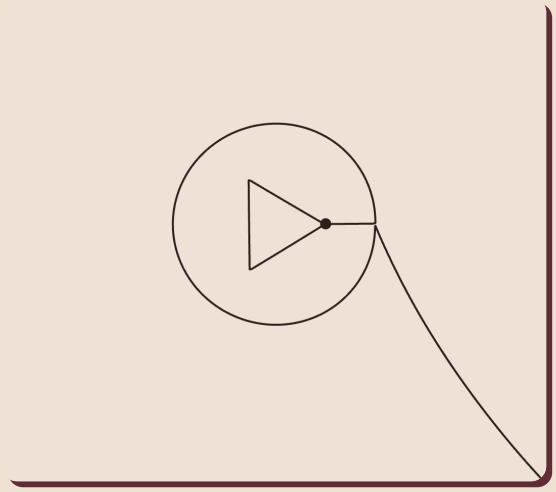

08

node canvas

github.com/Brooooooklyn/canvas

The browser's drawing canvas, but running in Node, so Claude can draw thousands of frames straight to ffmpeg without opening a browser. Fast for flat, cel shaded and pixel styles.

```
Using @napi-rs/canvas, draw an anime style sky
with cel shaded clouds, a train crossing a bridge
and falling petals, and pipe the frames straight
into ffmpeg.
```

Scenes stitched and graded

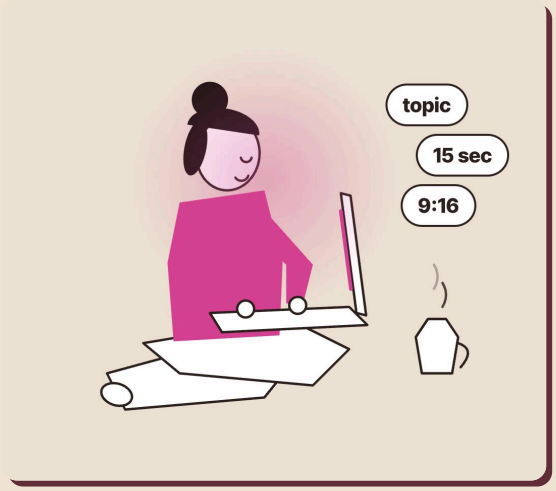

09

FFmpeg

github.com/FFmpeg/FFmpeg

The engine under almost every video tool. Claude uses it to stitch scenes, add transitions, stack a split screen, colour grade with a LUT and export for Instagram.

```
Stack my talking head on top and the animation
below as a 1080x1920 split screen, grade my half
with this LUT, normalise the voice to -14 LUFS
and export for Instagram.
```

Pop ups landing on my words

10

Whisper

github.com/openai/whisper

Transcribes your voice with a timestamp for every word. That's how each animation lands exactly when you say it, and how Claude spots repeated words to cut.

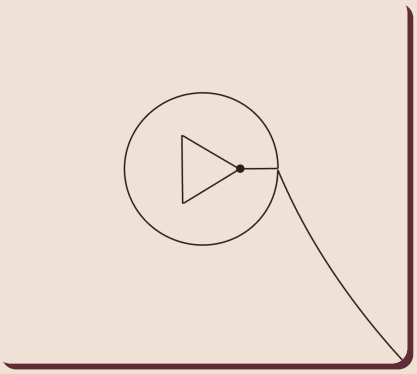

```
Transcribe my take with Whisper word timestamps,
keep the last clean take of every line, and time
each animation so it starts on the word it
illustrates.
```

PUT IT TOGETHER

My *workflow*

1. **Film your talking head first.** Then transcribe it with Whisper so every word has a timestamp.
2. **Pick one style per line** and one reference for each. Pinterest is perfect for this.
3. **Ask Claude to build each scene** with the library that fits: GSAP for type, p5.brush for paint, Rough.js for sketches, Three.js for 3D.
4. **Render each scene with HyperFrames** and stitch them with FFmpeg under your video.
5. **Make Claude check its own work**: snapshots of every scene, and a word by word re-transcription of the final so no repeated words slip through.
