FREE STARTER KIT

Claude Video *Editing Kit*

Everything from my "How I edit my YouTube videos" video: what Claude installs, how to set up your brand folder and playbook, the exact prompts I use, and the GitHub structure that makes Claude remember your feedback.

by Wiktoria Korbecka · Women Lead AI · womenlead.ai

HOW IT WORKS

I film. Claude edits. *I leave notes.*

Every YouTube video on my channel is now edited by Claude Code. I film in one long take, tell Claude where the file is, and about half an hour later I get a private review page where I pause on any second and leave a note, exactly like I used to with a human editor. I send all my notes at once, Claude fixes them, and version two appears on the same page.

$20
a month, the Claude Pro plan. The heavy rendering happens on your own computer, so the plan goes much further than you'd expect.

~10 min
of my time reviewing a video, instead of three days editing it or $300 for a freelancer.

YOU NEED FIVE THINGS

1. **Claude Code**, included in the Pro plan. I use the Claude desktop app (Code tab).
2. **Claude in Chrome**, the browser extension. It's how Claude finds and records b-roll.
3. **A handful of free tools** like ffmpeg and Whisper. Claude installs them for you (list on the next page).
4. **A free GitHub account**, so Claude remembers every bit of feedback you give it.
5. **DaVinci Resolve** (optional, free). I only use it for long, multi camera podcast episodes.

THE STEPS IN THIS KIT

1. Install everything with one prompt
2. Make your brand folder
3. Write your playbook (start with five lines)
4. Run your first edit
5. Set up the review page
6. Save everything to GitHub

Step 1

What Claude *installs*

You don't install these yourself. Open Claude Code in a new folder (I call mine "video editing") and paste this:

```
I want to edit videos with you. Check what you need to install for editing,
transcription and b-roll, install anything that's missing without needing admin rights,
then transcribe a 10 second test clip so we know it all works.
```

When the test clip comes back as text with a timestamp on every word, you're ready.

YOU SET UP ONCE

- ☐ **Claude Pro** ($20/month)
- ☐ **Claude desktop app** (Code tab)
- ☐ **Claude in Chrome**, signed in
- ☐ **GitHub account** (free)
- ☐ **DaVinci Resolve** (optional)

OPTIONAL CONNECTORS

- ☐ **ElevenLabs**: music and sound effects
- ☐ **Higgsfield**: AI shots and thumbnails, only when there's no real footage

CLAUDE INSTALLS FOR YOU

- ☐ **ffmpeg + ffprobe**: cuts and renders
- ☐ **Python 3**: runs the editing scripts
- ☐ **Whisper** (mlx-whisper on Apple Silicon): word by word transcript with timings
- ☐ **Pillow + NumPy**: captions, titles, graphics
- ☐ **rembg**: text behind your head
- ☐ **OpenCV**: keeps zooms framed on you
- ☐ **Playwright**: clean website screenshots
- ☐ **Node.js**: runs connectors
- ☐ **davinci-resolve-mcp** (optional)
- ☐ **Git + GitHub CLI**: saves your playbook

Step 2

Your *brand folder*

This is what makes your videos look like yours and not like everyone else's AI edits. Inside your project, make a folder called **brand** and put in everything a human editor would ask you for on day one.

- ☐ Brand guidelines PDF, if you have one
- ☐ Your font files
- ☐ Your logo (transparent PNG)
- ☐ Your brand colours
- ☐ Your colour look (a LUT file), if you film in a flat profile like S-Log

Then ask:

```
Read everything in my brand folder and write it down as rules for editing my videos:
fonts, colours, how titles and captions should look, and anything I should never do.
Save it as brand-rules.md.
```

MINE LOOKS LIKE THIS

```
- One typeface per video: Inter Tight
- Ink and pink are the only two colours
- Chapter titles: a big serif title behind my head
- Captions: two or three words at a time
- Logos on their own, never with the name written next to them
```

I didn't write these all at once. Most of them came from notes I gave on early videos. Step 6 shows how they get saved.

Step 3

Your YouTube *edit playbook*

One text file with the brief you'd give a new editor: how you film, what you want cut, how fast the video should be, what the graphics look like and what you hate. You don't need a perfect one. Start with five lines and let your feedback fill in the rest. Copy this starter version into a file called **youtube-edit-playbook.md**:

```
# My YouTube edit playbook

## How I film
- One long take. When I mess up, I say the line again without stopping.

## The cut
- Keep my LAST take whenever I repeat a sentence.
- Transcribe word for word, ums and restarts included.
- Never cut off the end of a word: let every cut run until the sound has faded.
- Speed the whole video up to 1.1x.

## Graphics
- Something changes on screen roughly every 10 seconds.
- Graphics sit beside me, never over my face.
- Real screenshots and screen recordings of real websites, not mock-ups.
- Follow brand-rules.md for fonts and colours.

## Delivery
- Always give me a review page before the full quality render.
- With every finished edit: titles, description with chapters, tags,
  pinned comment and thumbnail options.

## Things I hate
- (add your notes here as you go)
```

Steps 4 and 5

Your first edit and *the review page*

THE EDIT PROMPT

```
Here is the raw file for my new YouTube video: [path]. Read my playbook and my brand rules first. Transcribe it word for word, show me what you're going to cut, then find the b-roll and build me a review page once you're done editing.
```

B-ROLL WITH CLAUDE IN CHROME

```
Go through the transcript and list every moment where I mention a website, a tool or a video, with the exact second. Then use Claude in Chrome to open the real pages, close the cookie banners, scroll to the right part and capture them. Use official logos from the companies' own websites. My screen recordings are in Downloads: watch them and pick the right moments.
```

THE REVIEW PAGE PROMPT

```
Every time you finish an edit, make me a low quality preview and a private review page like Frame.io. I want to pause the video, leave notes at the exact timestamp, mark start and end points, draw on the frame, and send all my notes to you in one go. Keep each new version on the same page so I can compare them. Never do the full quality render until I've approved the review.
```

Add that last line to your playbook so it happens on every video without asking.

Step 6

GitHub, so Claude *remembers*

A new conversation with Claude doesn't remember the last one. If your feedback is written down somewhere Claude can read, it does. GitHub keeps those files with a full history of every change, on any computer and in any Claude session. Connect it in Claude under **Settings › Connectors › GitHub**, then ask:

```
Create a private GitHub repository called video-editing for this folder. Put my
playbook, my brand folder and any editing scripts in it. Do not upload any video files,
add them to the ignore list. Then commit and push.
```

THE FOLDER STRUCTURE

```
video-editing/
  youtube-edit-playbook.md
  brand/        guidelines.pdf, fonts, logo, LUT
  tools/        the scripts Claude writes (captions, graphics, colour)
  videos/
    my-first-video/   cut list + notes
  .gitignore    *.mp4  *.mov  *.MXF   (never the footage)
```

The habit that makes it work: whenever you give a note you'd want on every video, add "remember this and add it to my playbook on GitHub". You'll never have to say it again.

BEFORE YOUR FIRST EDIT

5 things that save *rounds of feedback*

1. **Ask for a word for word transcript**, ums and restarts included. Normal transcription tidies your repeats away and Claude can't cut what it can't see.
2. **Never cut off the end of a word.** A transcript says a word ends at a certain moment, but the "s" in "business" keeps going a little after that. Ask Claude to let every cut run until the sound has faded.
3. **Always review a preview first.** Full quality renders take ages and you'll almost always have notes.
4. **Real over generated.** Real screenshots and recordings first, AI only when there's no real footage.
5. **Give feedback like you would to a person.** "This feels slow", "that graphic is covering my face", "this looks too green, I want it warmer" all work.

HONEST LIMITS

On a long editing day you can hit the usage limit and have to wait for it to reset (long podcast episodes are where that happens). Rendering takes as long as your computer takes. Claude still makes mistakes, but those become notes.
